## **DETAILED ACTION**

### ***Specification***

1. The specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

### ***Claim Objections***

2. Claims 1-5 are objected to because of the following informalities:

Claim 1 recites the limitation "the duty ratio when an overvoltage is applied" in line 8. There is insufficient antecedent basis for this limitation in the claim. Applicant claimed a duty cycle in a range lower than an upper limit, but did not previously recite a [second?] duty cycle during an overvoltage. Claims 2-5 inherit by dependency.

Claim 2 recites the limitation "the power supply" in line 5. There is insufficient antecedent basis for this limitation in the claim. Does the applicant mean the power supply voltage recited in claim 1 or is this a power supply input? The applicant should clearly distinguish "power supply voltage" and "power supply."

Appropriate correction is required.

### ***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

Art Unit: 2838

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

4. Claims 1-5 are rejected under 35 U.S.C. 102(a) as being anticipated by Komatsu et al. (EP 1414145A1).

Komatsu et al. disclose a voltage conversion device, comprising: a voltage converter (12) converting a power supply voltage from a power supply (B1) into an output voltage (C1) such that the output voltage attains a target voltage, through a switching operation between a first switching element (Q1) as an upper arm and a second switching element (Q2) as a lower arm; and a control device (30) providing switching control to the first and the second switching elements using a duty ratio in a range lower (i.e. below 100% duty cycle) than an upper limit value of the duty ratio (i.e. 100% duty cycle never reached) even during an overvoltage being applied to the power supply. Plural motors (M1, M2). Plural inverters (14, 16). Direct current battery (B1).

### ***Conclusion***

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. US 6,486,632 Okushima et al. disclose a control device for parallel motor generators; US 6,204,627 Watanabe et al. disclose motor control apparatus.
